CloudWorks Casino

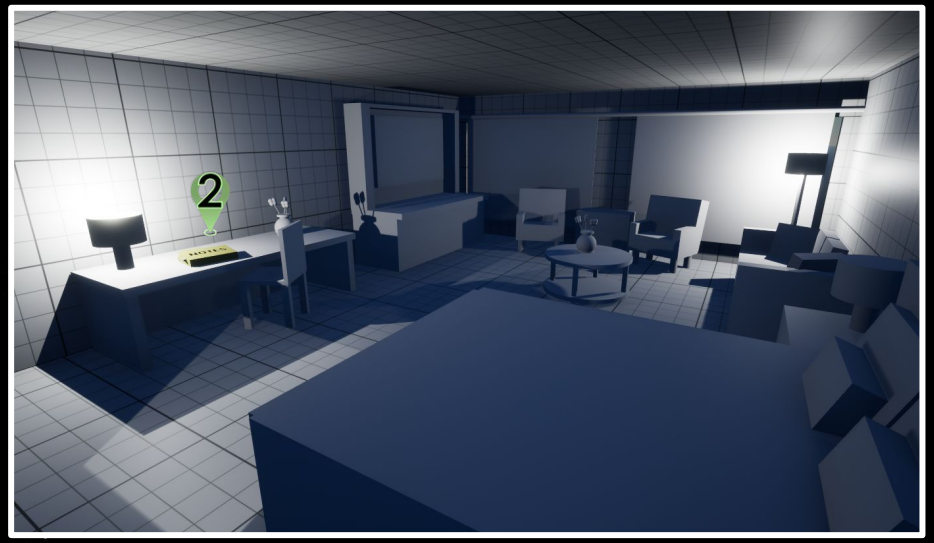

Changelist

Interior 2F - Changes

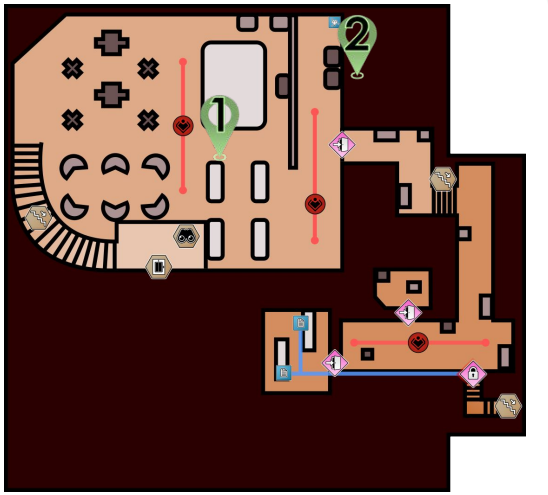

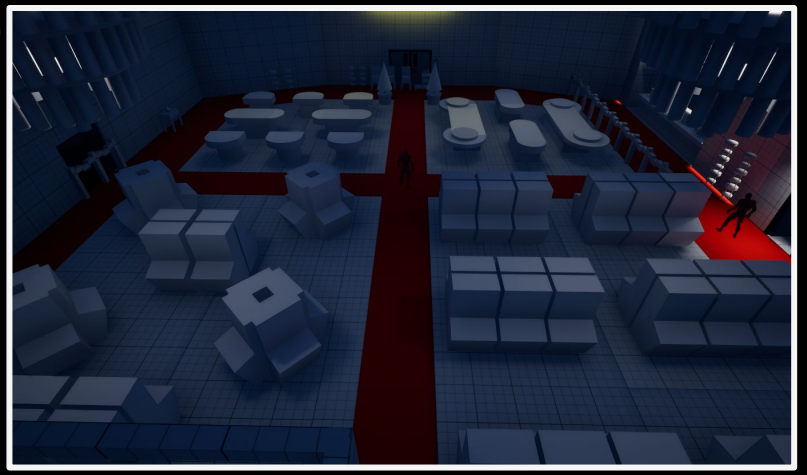

1 Added a hotel room to set the scene.

2 Added explicit mission brief to give the player general hints towards the direction of flow (progress downwards).

Interior 1F - Changes

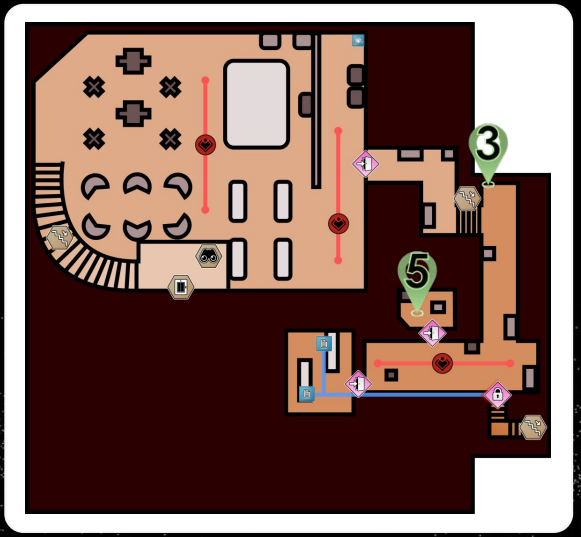

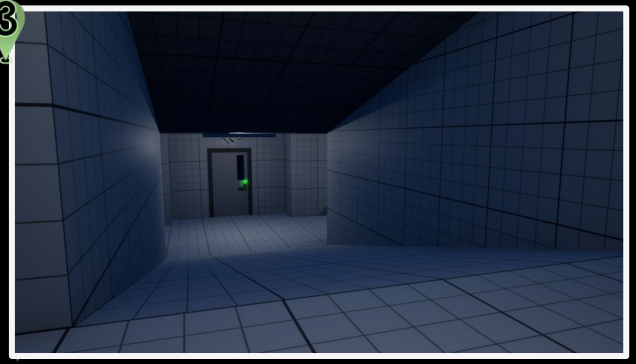

1. Slight rearrangement of props for to be more cohesive and allow for more traversal paths.

2. Added cashier counter to give more purpose to blocking stanchions and give a proper hiding spot.

Interior 1F - Changes

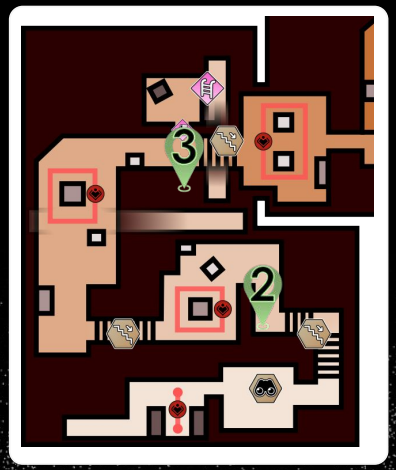

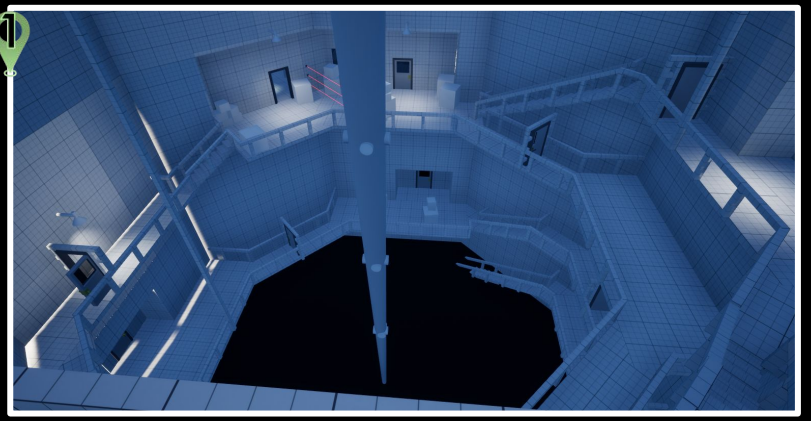

3 Removed one of the backroom hallways to introduce locked door objective sooner.

4 Added a second surveillance room attached to the first and moved the guard to this new room.

5 Moved one of the access code notes to the second surveillance room and added a third one to the nearby breakroom.

Interior B1 - Changes

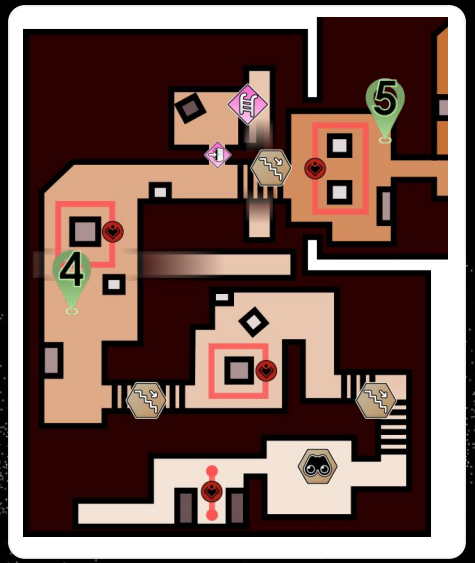

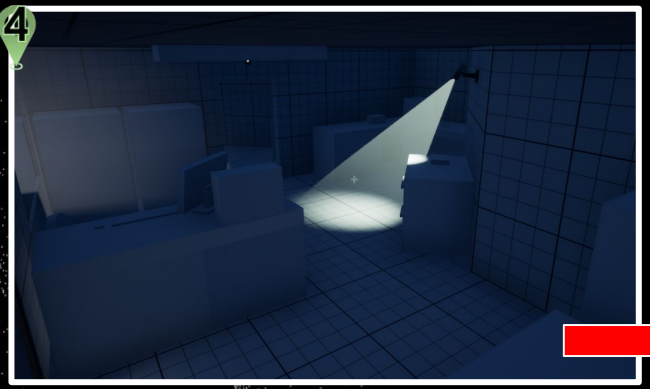

1. Expanded silo to have proper rounded shape, greater depth, and several floors.

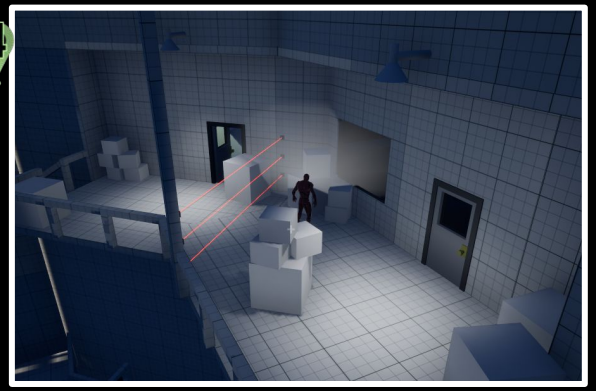

2. Added locked-door puzzle to first platform. First platform has become a storage room with a ladder. The play can climb into a vent which takes them to a second room containing the key.

3. Removed parkour traversal option for a more believable space and a tighter design experience

Interior B1 - Changes

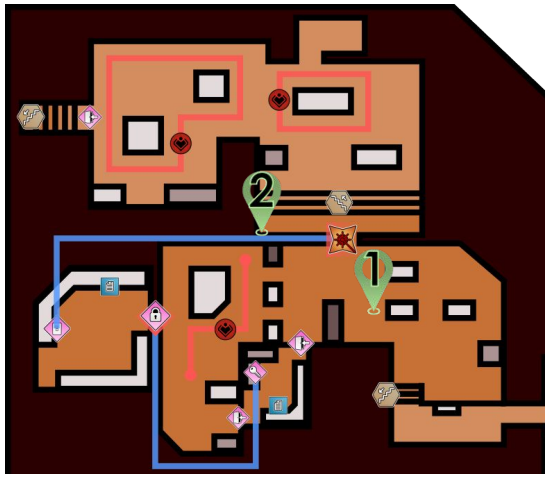

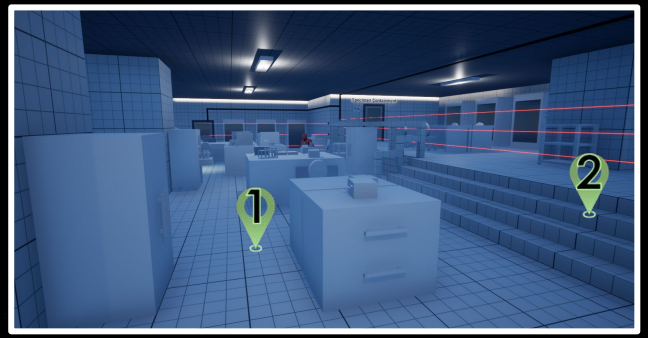

4 Added set of lasers on second platform to block the player's path. Two additional rooms contain navigation around surveillance cameras and must be traversed to get around to the other side of the lasers. This segment is meant to introduce the element of scanning cameras, adding gameplay variety and enhancing the feeling of a high-security location.

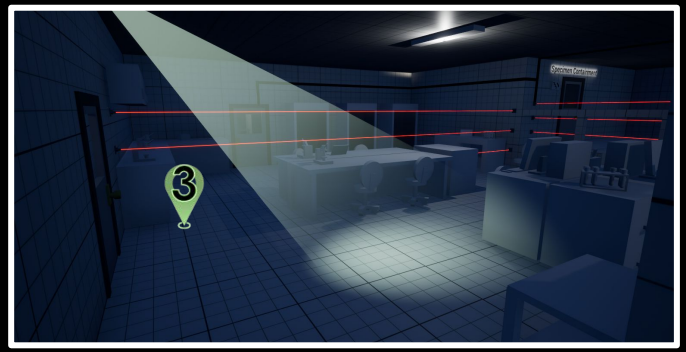

5 Removed third platform to create a more believable silo and reduce enemy count. Allows for the previous two platforms to stand out more as a difficulty increase.

Interior B2 - Changes

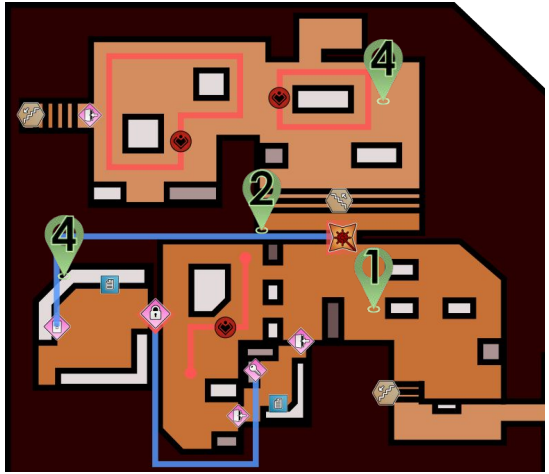

1. Small structural changes of prop placements for more realistic environment and more involved stealth

2. Removed wall separating the two lab rooms.
   - Pillars and railings now add separation while maintaining sightlines and challenge from the first guard.
   - Allows player to see more of what is on the other side of the lasers.

3. Added another set of lasers blocking one of the doors to this stealth section from the first room
   - Adds to high-security feel.
   - The laser can be carefully crouched under to approach the other room from a different entry point.

Interior B2 - Changes

4

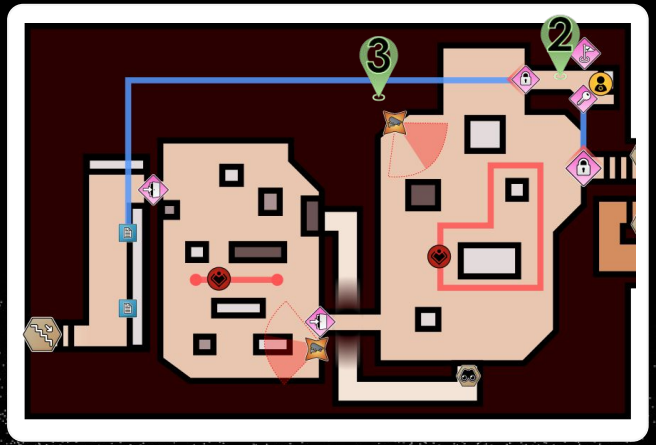

Removed first guard from second room and moved second room stealth sequence to be right before the breaker room.

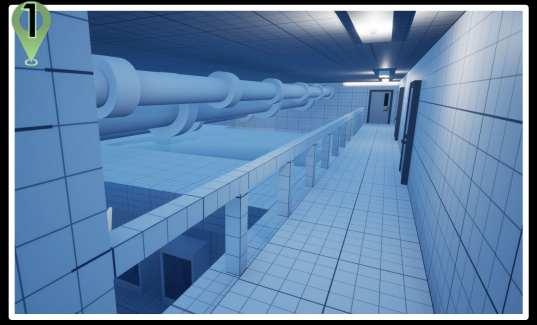

- Small side room now connects to this additional stealth section.
- Allows for more distance between encountering the lasers and getting to the power breaker to turn them off.
- Removed key requirement for breaker room to allow for more player experimentation with traversal options.

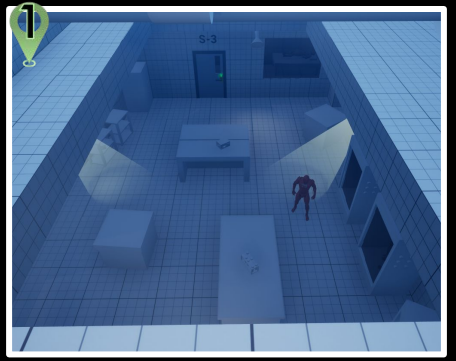

5

Added two cameras for increased stealth challenge and to add to high-security feel.

Interior B3 - Changes

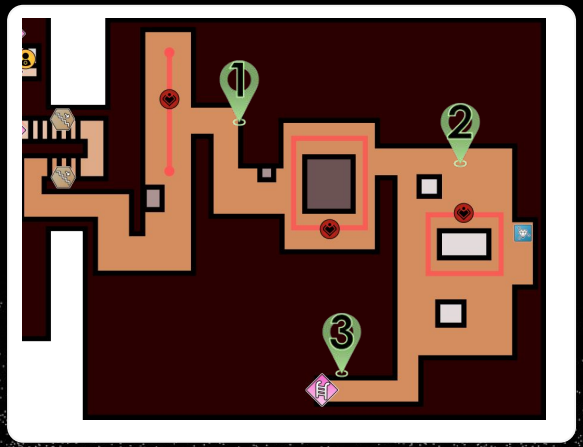

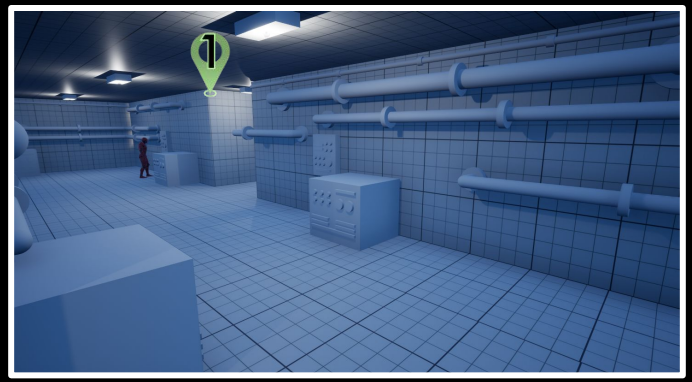

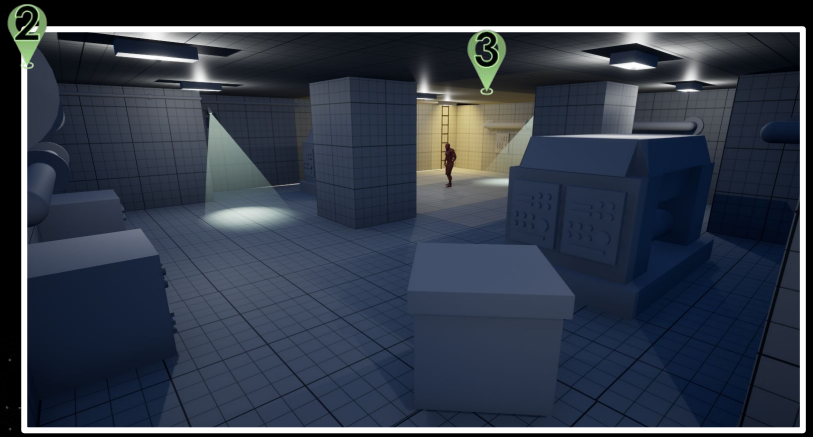

1. Added transitional path to before the specimen containment area. Glass ceilings allow for viewing of the lower sections to give an opportunity for planning and to build anticipation.
2. Moved objective cell to be visible from the entrance of the room.
3. Added one more surveillance camera and moved them to block simple pathways to the objective.

Interior B4 - Changes

1. Decreased space between first two rooms.
2. Expanded third room, added pillars and generator props for a more consistent challenge.
3. Moved ladder to be visible from entrance to the third room so the player can see the final objective.

Threat Overview - 1

1. Two security guards for the casino during closing hours. Simple pacing back and forth in an open area.

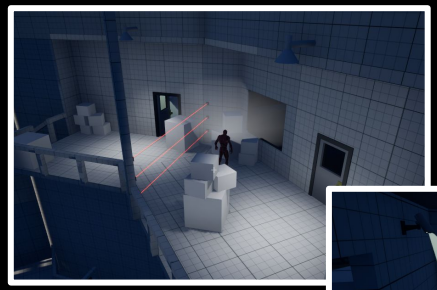

2. A security guard sits at the front desk as they review the surveillance system. Will not turn around unless they hear something behind them.

3. A single worker pacing around the control room. Simple circular motion requires careful movement and spatial awareness.

Threat Overview - 2

1. A lone scientist rummages through stacks of boxes of equipment. Simple rotation between two separate stacks. A set of surveillance cameras scan the adjacent office rooms. These require good timing and spatial awareness in tighter spaces. The player is forced to handle cameras as primary obstacles.

2. A scientist rotates between desks, analyzing studies and taking notes. A surveillance camera scans the front of the small room to the side. The more complex guard rotation and additional obstacle of the camera expand upon the previous navigation sections.

3. Another scientist rotates between three stations, running tests. A single camera surveys the entrance to the breaker room. Similar to the previous room, yet with a tighter space, necessitating that the player sneak very close to the guard while timing their movements with the camera.

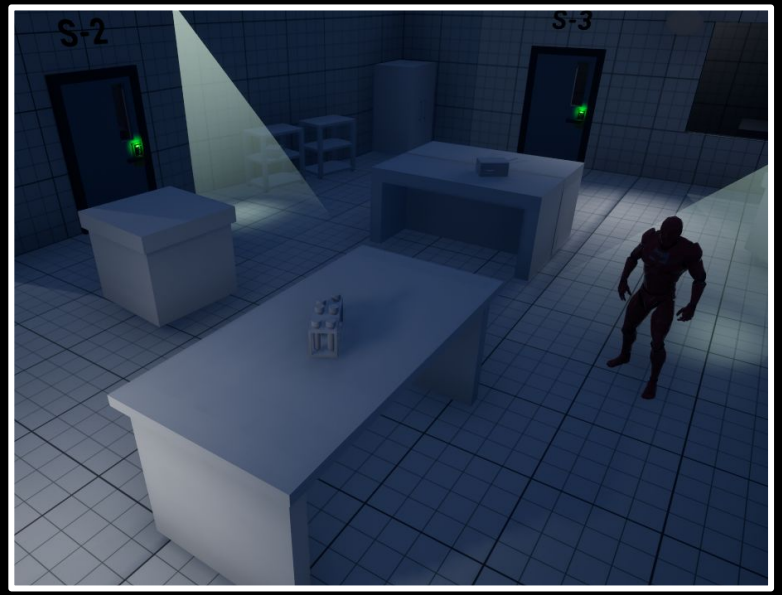

Threat Overview - 3

1 A lone scientist moves between a workbench and a bookshelf, performing research. A surveillance camera overlooks the exit of the room. Tighter space than the previous section and a smaller window for movement.

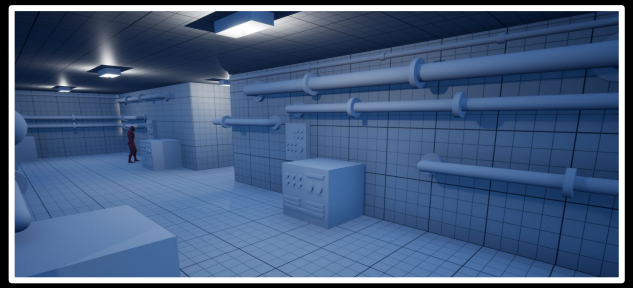

2 A security guard paces around the lab tables, keeping an eye on the prisoners. Two surveillance cameras near cover limit simpler pathways to the objective. One of the cameras requires that the player deduces the right time to approach the objective door to quickly input the access code before the camera pans back. This additional timing layer is made more complex with the guard's rotation as they sometimes have a view of the objective door.

Threat Overview - 4

Escape sequence initiated, giving the player one minute to traverse the utility tunnels. Two maintenance workers pace back and forth as they analyze various systems. Several surveillance cameras are placed about. The simpler and more straightforward room layout is made to complement the time pressure of the escape sequence.

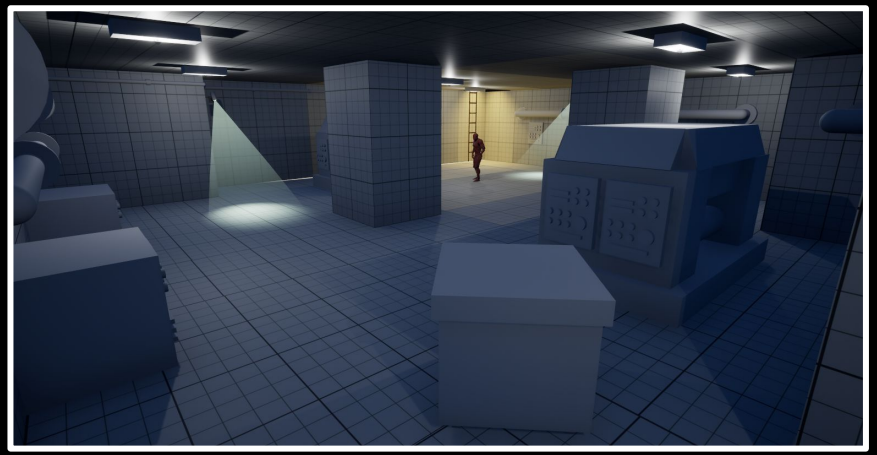

Traversal Options

- More thought was put into making several traversal options more clear in open areas.
- Players often have the choice of a faster approach that comes with more risk.
- Players are encouraged to analyze their surroundings for hidden paths or more consistent safe points.

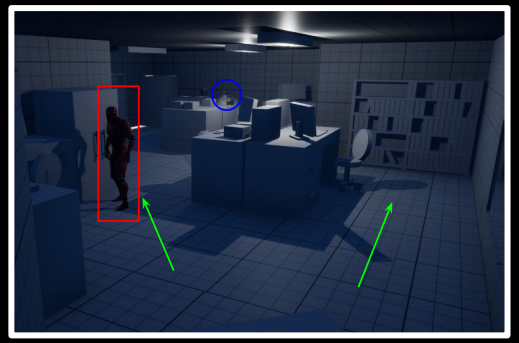

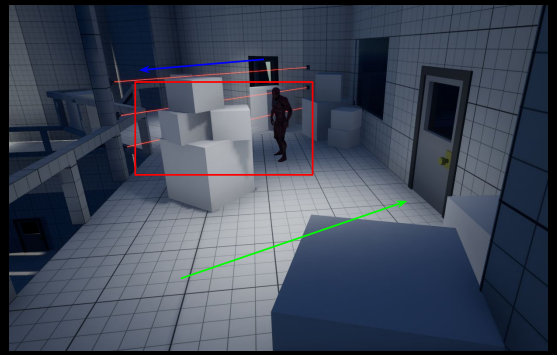

Two sections involving parkour were removed to focus the design around navigating tighter spaces. In one of these spaces, it would be impossible to jump accurately without making enough noise to alert nearby guards. In the other space, the planned parkour paths did not make as much logical sense in the world.

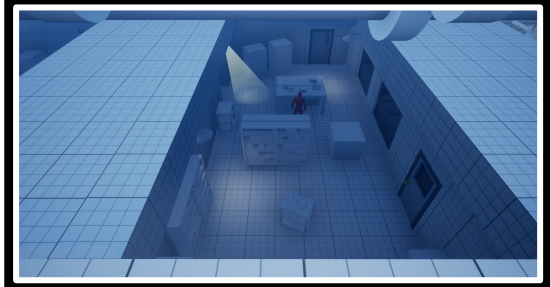

Improved Sightlines & Vantage Points

- Vantage points were adjusted to be more helpful with planning or to add to communicate aspects of the world to the player.
- Sightlines are improved to give the player more information and allow them to execute stealth actions more effectively.
- More intentionally communicate threats, objectives and pathways.

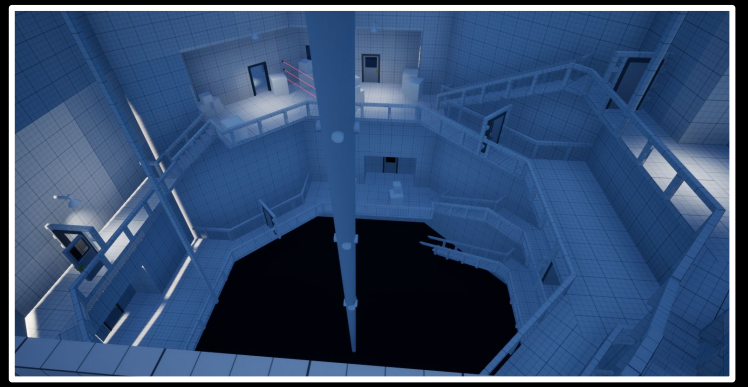

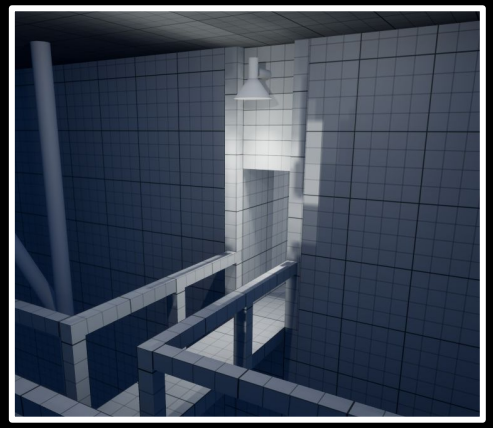

Guidance - Lights & Pickups

Lights and pickups are used to draw that player's attention to key elements of gameplay.

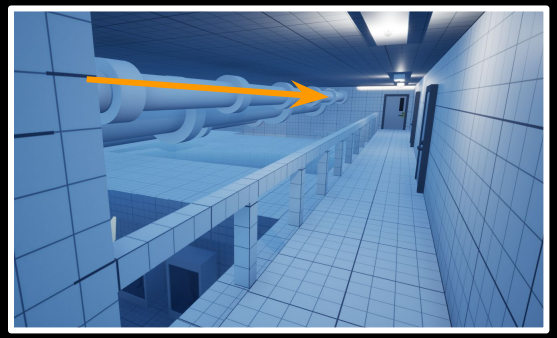

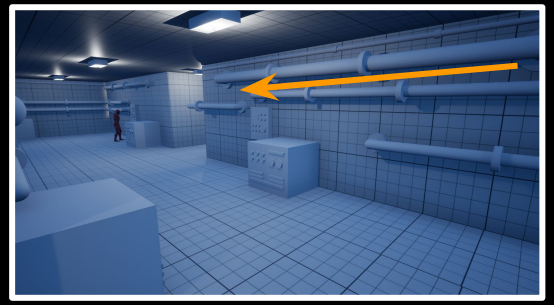

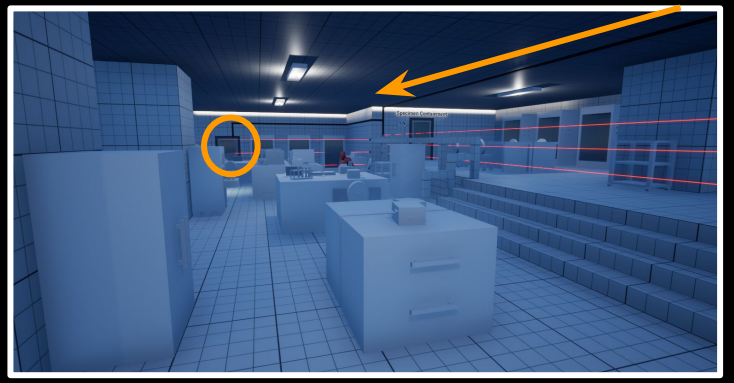

Guidance - Leading Lines

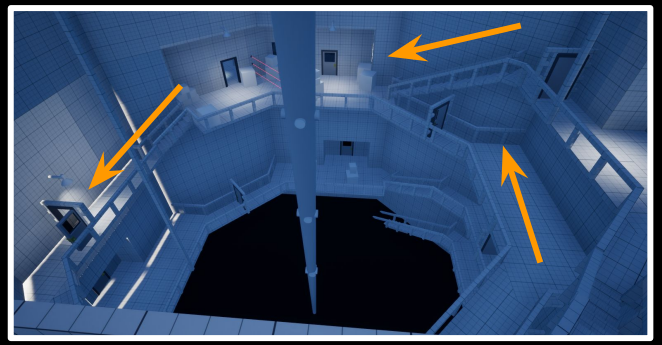

The general structure of certain areas contains lines that guide the player's eyes towards objectives.

Here, a line of wires leads the player's eyes from lasers blocking their path to the door at the back. This allows them to deduce that the key to disabling these lasers must be related to something past that door.

Polish - Invisible Walls

Invisible collisions are used to ensure that the player's gameplay experience is polished and consistent, avoiding them from glitching into out of bounds areas and being forced to restart the game.

These are also used in spaces intended to be for player planning. Normally, enemy guards would be able to see the player at higher elevation or through glass. Therefore, adding invisible walls allows the player to analyze their surroundings without being spotted (since the AI's vision cone still collides with it).
